

WELLSITE SERVICES

Petricore has fully equipped personnel and cabins certified by the industry to successfully perform formation evaluation services in both land and offshore wells.

Our services include:

- Real time drill monitoring.
- Continuous logging.
- 24-hour sample catching.
- Examination for rock type.
- Hydrocarbon presence and formation gas measurement.
- Bio-stratigraphic analysis.
- Organic geochemical analysis by mass spectrometry.
- Inorganic geochemistry by XRD and XRF.
- Data acquisition, reporting and formation logs are prepared in accordance with client requirements.

QUALITY ANALYSIS ON TIME, EVERY TIME.

MAXIMIZATION OF OPERATIONAL ASSURANCE

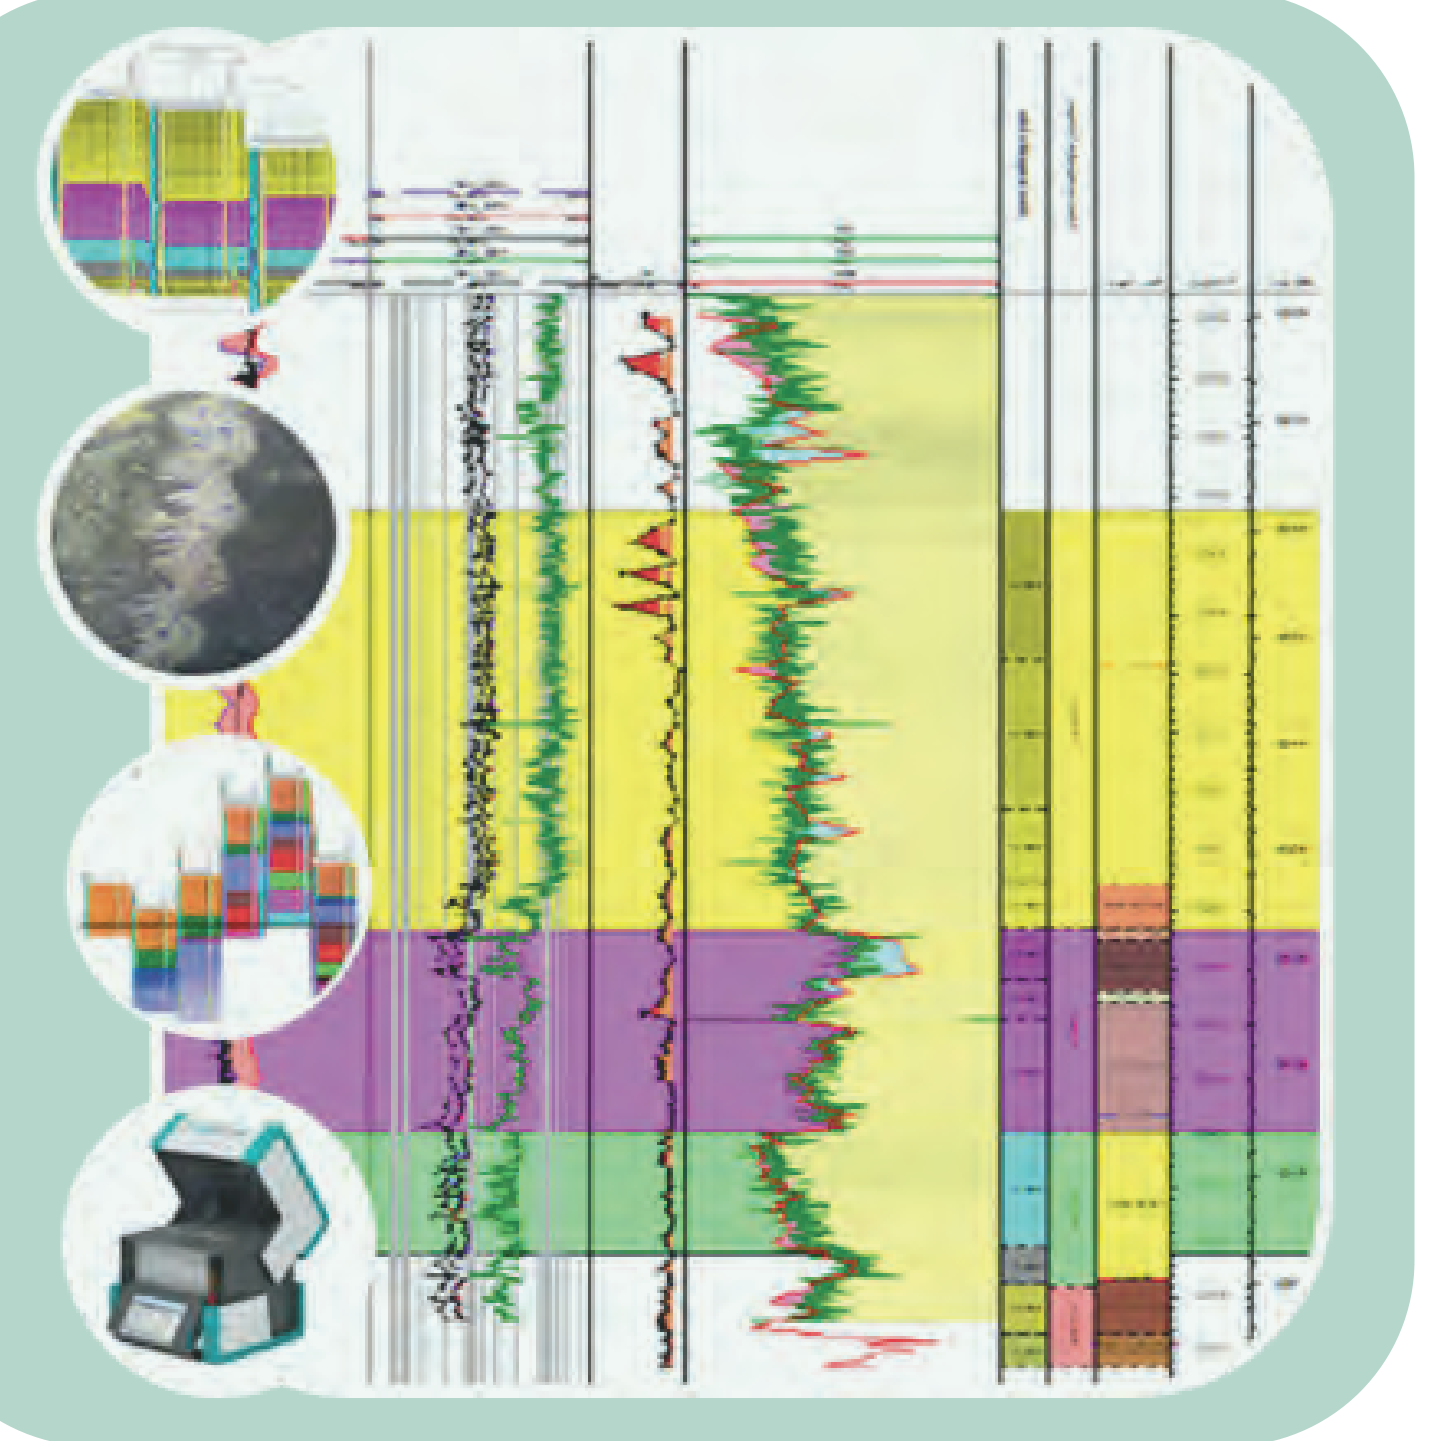

Petricore offers real-time data collection of paleontological markers and elements, enabling precise stratigraphic tracking during drilling. This practice enhances efficiency and optimizes well completion. Additionally, it includes surface measurement of cutting samples and mud gas during drilling. This allows operators to make crucial decisions promptly, such as defining casing points and core extraction intervals, resulting in significant cost savings.

Analog well correlations for timely tracking while drilling

Monitor areas with potential anhydritization processes and potential collapse zones

Redefine the geological model by obtaining paleoenvironmental parameters as well as age assignment in conjunction with our integrated paleontological study

Quantification of elements that allows a detailed analysis of the formation

Results in real time

Dynamic and comprehensive deliverables are generated from drilling cuttings collected at the wellhead, providing high certainty for remote and on-site decision making, which allows for reduced NPTs and geological uncertainty, as well as continuous drilling even in the event of BHA signal loss.
